Nearest-neighbor line: goal needs V−1 = 4 steps to reach latest call
Central hub: goal broadcasts to every cell in exactly 1 step
Binary call tree: recent calls are siblings with O(log V) diameter
Row-softmax edge weights initialised at the tree; largest weights, seed 0

Meta (learned)
goal
No graph: all cells concatenated; cell identity is solely input offset
Deep bootstrap trees voted in parallel; each split tests a single feature
Shallow sequential additive trees; each tree fits prior pseudo-residuals
Steps for goal intent to reach cell; Star & Tree achieve O(1)/O(log V) hops
